Rank: Correct Answer: This is a customized dog crate I made as a project during quarantine. This dog crate was created as an addition to a kitchen counter instead of using a metal dog kennel. To begin this project, I had to design something that would fit perfectly within the dimensions I had to work with. I began by figuring out/designing how I would want the crate to look...the style....I needed to also figure out where I would like materials, a way dog could get in/out from the crate. To start building, I started by using two pieces of wood for both the top and bottom of the crate. The walls were built using wooden dowels drilled 3/4 inch holes into wood strips bound on top and bottom that the wooden dowels would fit through. This was a great creation for the back and front wall, which would be attached to each other by running them down the sides. The dogs would have no problem getting onto or off the crate because they can go over the side rails. The door opening was designed so that the dog's head would slide right under the floor and ceiling of the crate that would guide the door open and shut. The door would open to a position in front of a stationary wall that covered half the front of the crate. Also four bun feet were added to each corner.I finished the crate by adding a trim around the top and bottom to cover up the wheels of the door and track the door would slide in. I added a safety handle and a latch for the door to be locked. I painted the crate gray to match the counter it would be positioned next to. I sewed a gray pillow to match the paint color. This post may contain affiliate links. It doesn't cost you anything extra and it keeps our lights on, our families fed, and our dogs spoiled. For all the juicy fine print, see our affiliate disclosure I vividly remember the weeks leading up to Maggie coming home for the first time. I spent every day researching exactly what she'd need and how I could make her feel at home. Buying a crate was one of the first things that would pop up in my search results. Crates are important for puppies, and I wanted her to feel as safe and happy as possible. I set out on an internet journey, comparing all the crates and prices until I finally found the right one for her size and my budget. When it arrived, I was confused and even a little panicked. How was I supposed to put it together, much less break it down for future vacation with Maggie? Here's the guide I wish I'd had during that time. Wire crates are really no big deal, and you're about to find out just how easy they are to handle. It's so important to have the crate ready to go for your dog. They're the modern version of a wolf den. Dogs use them to feel safe and have their own space [1]. Don't worry about not knowing how to put it together. Try these easy steps and your crate will be functional in no time! Does your dog feel anxious, not comfortable, in their crate? Click here for some tips on how to make them feel more comfortable or here for how to stop puppy whining! Taking the crate out of its box sounds easier, right? It's actually heavier and more awkward than I expected, so grab a friend or family member to help. You'll be surprised how simple it is once you know the trick. Step 1: Lay Out Your Crate. First, lay out the plastic panels flat against a wall. If you don't have a wall nearby, lean them against something sturdy like a bed frame. The Plastic Pan Dogs have to have the plastic pan inserted in the bottom of the crate, or else they'd be extremely uncomfortable on the metal bars[2] (check out our tips on how to make your dog more comfortable). Double check that the plastic pan has been slid into the bottom of the crate and that the pan is flat on the floor. Step 2: Lift the Top Layers. Although the wire crate may look like a jumbled mess, it's already all connected. You won't need to assemble the crate piece individually, which saves you a lot of time. Instead, all you have to do carefully lift the top layers of the crate. These will be the front and back of the crate, laying on top of each other. Try to lift them up and lean them back so they're no longer on top of the crate. Someone can also hold these upright for you if you have a helper. Step 4: Pull Up the Last Layer The last layer is a combination of the top of the crate, plus the two sides. They're all connected, so they should pull straight up easily. Step 5: Hook the Crate There should be small metal hooks at the top edges of both the front and back of the crate. Hook them over the top of the crate to secure both pieces in place. Look for any other hooks that need to be latched in the same way. Different sized crates will have different amounts of hooks. Step 6: Test It Out Apply light pressure to the top of the crate and push gently on each side. If anything feels too loose, check for more hooks. The crate should be able to take the weight of your dog leaning or pushing against it. Step 7: Insert the Crate Divider If you're setting up your crate for a puppy, your crate probably came with a crate divider. It's one piece of the crate that isn't attached to anything else. The crate divider keeps your pup from wandering around the crate and going to the bathroom while they're in it.[3]. It'll have two hooks on either side that attach sideways to the walls of the crate. If your dog is a little older and already knows where to go to the bathroom, set the crate divider aside for any future puppies you may bring home. Video If you're more of a visual person like me, here is a video showing how to build a wire crate step-by-step. Step 8: Final Thoughts A wire crate is a handy tool for many reasons. Whether you're training a new puppy or giving your adult dog a designated sleeping area, having a crate makes life easier for everyone involved. Plus, it gives your furry friend a cozy spot to curl up whenever they want. So why wait? Get yours today and enjoy all the benefits it has to offer!

I would go home for the upcoming holidays. Don't wait a few months to face this fear like I did! Crates are just as easy to take apart as they are to put together. Here are the 3 simple steps to collapse a dog crate. Step 1: Unhook Everything To get the crate to collapse, you'll need to unhook everything. Completely remove the divider if you're using one, and then unhook all the walls of the crate. Step 2: Fold in the Top The top should collapse onto the crate tray along with the two side walls. Let it collapse naturally and just make sure it's flat once it's all down. Step 3: Fold Down the Sides The front and the back should then fold down on top rest of the crate, forming a very flat rectangle of metal bars. Some crates feature extra hooks that will hold everything in place once it has been collapsed, but others don't. Look around for these hooks to be sure. Also, don't worry about the crate pan. You can leave it in there without bulking up the crate. Video And here's a video showing the steps for how to collapse a metal dog crate: Conclusion Maggie's first small crate was easy to fold into and out of place by myself, but her larger crates in the future got more difficult. Nothing changed about how I put them together, but I found that I needed a second person to help hold everything in place before the hooks were used. Don't forget that your crate will also come with an instruction pamphlet, so you can always double-check that as you assemble or disassemble it for more specific guidance.
